

$$p_\theta < 0, H = 1.40$$

$$\oint z_p dz_q = 16.36$$

(a) the learned chart. The level set at $H = 1.40$ on the branch the data cover runs outside γ_- , and so takes the shaded γ_+ in. The arrows are the induced orientations.

H	area A
— 1	1.84 (γ_+)
— 1.001	1.83
— 1.14	1.43
— 1.40	0.94
— 1.60	0.61
— 2.00	-0.04

(b) the boxed lobe, magnified. The $p_\theta > 0$ levels start *inside* γ_+ and shrink, then cross out of it; by $H = 1.60$ the curves self-intersect, and at $H = 2.00$ the signed area is negative.
